DESIGN PROCESS

Listing:

First I made a list of requirements that I need to touch on.

Naming the pages:

To design the portfolio I went through the Assessment requirements first. Then I thought of the name of four pages of portfolio website. Before I decided the page names, I went through some other portfolio examples to have an idea.

Mock up:

First put some ideas on paper and then played a bit with them in figma to make sitemap and some wireframes.

Icons and Images:

Sourced free icons and images. Initially used “Paint” to resize the images then used css to fit them well in website pages.

DEVELOPMENT/BUILD PROCESS

Challenges:

Taking decisions on which colour I should go for the website was bit challenging. While working on different containers, choosing units like % or vh/vw or px was not hassle free.

Favourite parts:

Using different types of images and using dotted borders for my Blog page was pretty fun. Choosing Google font was great as well.

Build process:

HTML and CSS was fun but not that easy I thought at the bigenning.

COMPONENTS

Navigation bar:

User can switch to different pages from the navigation bar.

Icons links:

User can click on the link below the icons and go to my Github and LinkedIn account.
